

8-2 Cyber Playbook Submission: IS Audit Basics

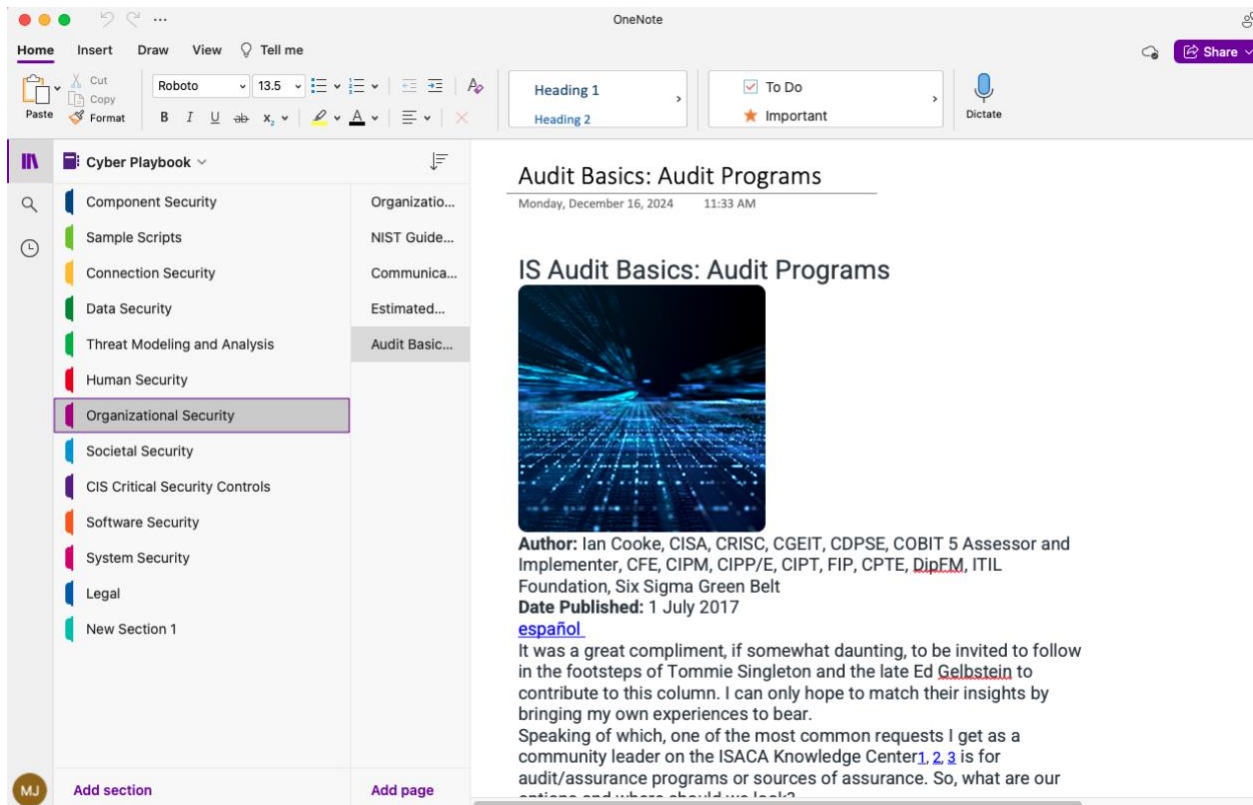

Joshua Merren

Southern New Hampshire University

CYB-400-13637-M01 Security Assessment & Auditing

Professor Jillian Seabrook

16 December 2024

The item I chose from this course's cyber playbook is *IS Audit Basics: Audit Programs* because it provides a strong foundation for understanding the importance of audits in cybersecurity. Audit programs are essential for identifying risks, assessing security controls, and ensuring compliance with industry standards like ISO, NIST, and COBIT. As someone preparing for a cybersecurity career, understanding how to conduct and navigate audits will be a critical skill I can apply in real-world scenarios. This resource is valuable because it shares insights from experts like Ian Cooke, who bring practical knowledge that I can use to evaluate systems, detect weaknesses, and improve security measures. Audits help confirm that organizations meet security requirements and play a key role in reducing vulnerabilities and preventing potential breaches. By learning about audit programs now, I can be better prepared to contribute to protecting organizations and their information systems in the future.
